Attention: The drawing below is not appropriated to all models. Look at in our website all specific draws.
***Note:** 73mm less for the "No-return models"

Intake Valve

RH Series

APPLICATION: Installed on the compressor inlet to control its capacity. At start-up, the valve remains open till the minimum suction pressure closes the valve. During normal operation, the valve opens and closes in response to a this signal that meets the air demand. At shutdown, a check valve remains closed and keeps the suction. The valve is also available in the non-return and proportional version.

INSTALLATION: On the suction flange of the air-end, either directly or by flange adaptor, depending on the type of air-end. The ON/OFF system must be connected to the pressure signal and solenoid valve.

REPLACEMENT: The stress on valve parts depends on compressor application and operating parameters. Replacement should take place with VMC spare parts kit after 8.000 operating hours.

Minimum Pressure Valve

OPERATION: The Minimum Pressure Valve which is installed after the oil separator, has two functions:

- during start-up, the valve remains closed until the opening set-up pressure. Then it opens in order to maintain minimum pressure in the air-oil separator. In this way, pressure can lubricate the compressor unit;
- during shutdown, the check valve is closed to prevent backflow from the line through the compressor.

INSTALLATION: The Minimum Pressure Valve is installed at the discharge port of the separator. It can be threaded or flanged.

REPLACEMENT: It depends on compressor applications and working conditions. Valve inspection and its replacement is recommended 8.000 running hours. VMC original spare parts have to be used.
